

# Week 12

## *Business Research Methods*

**Bhaswar Chakma**

11 May 2021

# Objectives

- Create “Toy Data”
  - `data.frame()`
  - `tibble()`
  - `tribble()`
- Reproducible example
- Export
- RMD:
  - tables: regression; statistics
  - equations

# “Toy Data”

- `data.frame` ?
- `tibble`?

# data.frame

```
class(iris)
```

```
## [1] "data.frame"
```

```
iris
```

	Sepal.Length	Sepal.Width	Petal.Length
1	5.1	3.5	1.4
2	4.9	3.0	1.4
3	4.7	3.2	1.3
4	4.6	3.1	1.5
5	5.0	3.6	1.4
...			

# tibble

```
iris %>% as_tibble()
```

```
# A tibble: 150 x 5
```

	Sepal.Length	Sepal.Width	Petal.Length	Petal.Width	Species
	<dbl>	<dbl>	<dbl>	<dbl>	<fct>
1	5.1	3.5	1.4	0.2	setosa
2	4.9	3	1.4	0.2	setosa
3	4.7	3.2	1.3	0.2	setosa
4	4.6	3.1	1.5	0.2	setosa
5	5	3.6	1.4	0.2	setosa
6	5.4	3.9	1.7	0.4	setosa
7	4.6	3.4	1.4	0.3	setosa
8	5	3.4	1.5	0.2	setosa
9	4.4	2.9	1.4	0.2	setosa
10	4.9	3.1	1.5	0.1	setosa

```
# ... with 140 more rows
```

More details:

<https://r4ds.had.co.nz/tibbles.html>

# data.frame()

```
df1 <- data.frame(  
  guitarist = c("Joe Satriani", "Eric Johnson"),  
  year = c(1987, 1990),  
  song = c("Always With Me, Always With You",  
           "Cliffs of Dover")  
)
```

```
class(df1)
```

```
## [1] "data.frame"
```

```
df1
```

```
##      guitarist year      song
## 1 Joe Satriani 1987 Always With Me, Always With You
## 2 Eric Johnson 1990      Cliffs of Dover
```

# tibble()

```
df2 <- tibble(  
  guitarist = c("Joe Satriani", "Eric Johnson"),  
  year = c(1987, 1990),  
  song = c("Always With Me, Always With You",  
           "Cliffs of Dover")  
)
```

```
class(df2)
```

# RStudio Community

All things RStudio

FIND HELP

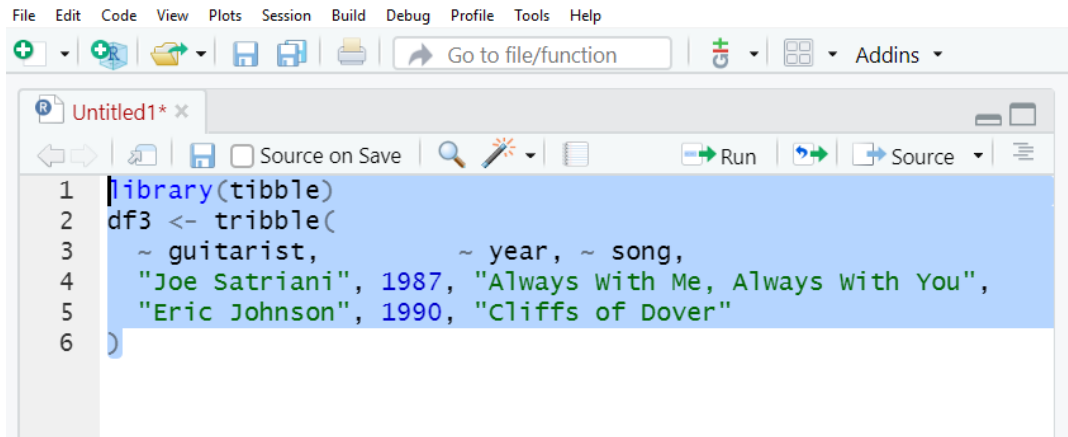

CONTRIBUTE

EXPLORE

## 1 Select your code

The screenshot shows the RStudio IDE interface. At the top is a menu bar with options: File, Edit, Code, View, Plots, Session, Build, Debug, Profile, Tools, and Help. Below the menu bar is a toolbar with icons for creating a new file, opening a file, saving, printing, and navigating. A search bar labeled "Go to file/function" is also present. The main editor window displays a script titled "Untitled1\* x". The script contains the following R code:

```
1 library(tibble)
2 df3 <- tribble(
3   ~ guitarist, ~ year, ~ song,
4   "Joe Satriani", 1987, "Always With Me, Always With You",
5   "Eric Johnson", 1990, "Cliffs of Dover"
6 )
```

The code is highlighted in blue. The editor window also shows a toolbar with icons for navigating between files, a checkbox for "Source on Save", and buttons for "Run" and "Source".

## 2 Click Addins then Reprex selection

The screenshot shows the RStudio application window. The top menu bar includes File, Edit, Code, View, Plots, Session, Build, Debug, Profile, Tools, and Help. Below the menu bar is a toolbar with icons for adding files, saving, printing, and navigating. The main editor window displays a script titled 'Untitled1\*' with the following R code:

```
1 library(tibble)
2 df3 <- tribble(
3   ~ guitarist, ~ year, ~ song,
4   "Joe Satriani", 1987, "Always With Me, Always
5   "Eric Johnson", 1990, "Cliffs of Dover"
6 )
```

The code is highlighted in blue. To the right of the editor, the 'Addins' menu is open, showing a list of add-ins: BOOKDOWN, Preview Book, Input LaTeX Math, CLIPR, Value to clipboard, Output to clipboard, REPREX, Render reprex..., and Reprex selection. The 'Reprex selection' option is highlighted with a yellow box.

FAQ: What's a reproducible example (``reprex``) and how do I create one? meta 

Why reprex? Getting unstuck is hard. Your first step here is usually to create a reprex, or reproducible example. The goal of a reprex is to package your code, and information about your problem so that others can run it and feel your pain. Then, hopefully, folks can more easily provide a solution. What's in a Reproducible Example? Parts of a reproducible example: background information - Describe what you are trying to do. What have you already done? complete set up - include any `library()` calls and data to reproduce your issue. data for a reprex: [Here's a discussion on setting up data for a reprex](#) make it run - include the minimal code required to reproduce your error on the data p...

```
# ols
```

```
m0 <- lm(low ~ smoke + race + ht + ui + ftv + age + lwt,  
          data = MASS::birthwt)
```

```
# logit
```

```
m1 <- glm(low ~ smoke + race + ht + ui + ftv + age + lwt,  
           data = MASS::birthwt,  
           family = binomial(link = "logit"))
```

```
# probit
```

```
m2 <- glm(low ~ smoke + race + ht + ui + ftv + age + lwt,  
           data = MASS::birthwt,  
           family = binomial(link = "probit"))
```

```
```{r regtable, results='asis'}  
stargazer::stargazer(m0, m1, m2,  
                      type = "latex", # "html" for html  
                      title = "Results",  
                      header = FALSE,  
                      label = "tab:regression1")  
```
```

## Important:

- `results='asis'` must be included
- `label = "tab:regression1"` is needed for cross-referencing
  - You can `regression1`; use something else

# Equations

We need  $\text{\LaTeX}$ !

$$(x + a)^n = \sum_{k=0}^n \binom{n}{k} x^k a^{n-k}$$

Save as New Equation...
